

AI agents that run on **your own hardware** — and refuse to make things up.

Local-first AI infrastructure, deployed for SMEs and institutions.

Your files never leave your office. Your agent shows its sources.

The 75-second version

Watch the agent query its own machine map, act on real files — then get **refused** when it tries to assert something it cannot verify.

The proof, in one exchange

```
agent: /data/q3-report is the authoritative Q3 file
system: REJECTED – structural_gate
       reason: that path is not in the machine's derived facts.
       The agent may not invent structure. Ever.
```

Every fact an agent stores about your organisation is validated against mechanically collected ground truth. Hallucinated context doesn't just get flagged after the damage — it never gets stored.

Engagements

RM3–5k fixed · 1 week

Audit

- Where your information lives and leaks
- What AI can safely take over today
- Written roadmap — useful even if we never work together

RM10–20k fixed · 2–3 weeks

Setup Sprint

- Agent running on YOUR machines
- Email, files, calendar wired in — nothing leaves site
- Your team trained to run it without me

RM2–4k monthly

Retainer

- Maintenance and new integrations
- New workflows automated as they emerge
- Priority response

Who's behind this

Ammar Footen — developer of [Al-Mizan](#), a knowledge system built on a simple discipline: *an agent must show where every claim comes from, or not make the claim*. The same discipline powers everything deployed here — applied to your business documents instead of classical texts.
